Dosis Letal 50

- ♦ La DL50 (Dosis letal 50%) oral aguda significa la "cantidad de una sustancia que es necesario ingerir de una sola vez para producir la muerte del 50% de los animales en ensayo". Esta dosis se expresa generalmente en mg/kg de peso del animal ensayado.
- ♦ La toxicidad dermal aguda, se refiere a la aplicación de una sola vez de un producto sobre la piel afeitada del animal en ensayo, que normalmente es el conejo, aunque se utiliza también mucho la rata. Al igual que la toxicidad oral aguda se expresa en términos de DL50 y en mg/kg de peso

Tabla XIII

*Consumo de alimentos (g por persona y día).

LD50 of Polonium 210: estimated from 10 (inhaled) to 50 ng (ingested) in humans, makes the substances more commonly known. Oral table salt LD50 (cominal salt): 3000 mg/kg in rats. Nicotine LD50: 50 mg/kg in rats. The test was created by J.W. Trevan in 1927, but is now progressively withdrawn in favour of the fixed-dose procedure. The average contagious dose (ID50) is the number of organisms received by a person from a certain mode of administration (e.g. 1,200 oral horr). In these cases, the lethal dose is qualified by the duration of the exhibition (e.g. 10 minutes). Choosing 50% mortality as the model test avoids the possible ambiguity of taking measurements at the ends and reduces the amount of tests required. In the case of some neurotoxins such as Batrachotoxin, one of the most well-known fatty poisons, the LD50 can be more conveniently expressed as micrograms per kilogram 1/4g / kg of body mass. These measures are generally used to indicate the comparative effectiveness of chemical warfare agents. Measures such as ^À Àld1^À ^À and ^À - Àld99^À ^À (the dosifcation required to kill 1% or 99% of the population tested, respectively) are sometimes used for specific purposes. These measures are most commonly used within health radiations, as survival beyond 60 days generally results in recovery. For disease-causing organisms, there is also a measure known as contagious average dose and dosage. Toxic Concentration From Lowest Possible PUBLISHED DOSE (TCLO) Fatal Dose Lowest Possible Published (LDLO) IC50 (50% Inhibitory Concentration) Some chemicals, such as hydrogen cyanide, are rapidly through the human body, and do not follow Haber's law. A comparable measure is LC150 which refers to the lethal dose of exposure, where C is the concentration and t is the time. Usually the LD50 of a substance is expressed as mg/kg body weight. In toxicology, the LD50 (abbreviation for ^À"Lethal Dose, 50%^À") is the dose of a substance or radiation that is lethal to half a group of experimental animals. One gram theoretically could poison 100 million people, 50 million of whom would die. IC150 is the dose that will cause disability rather than death. LD50 of batrachotoxin: estimated to be 1-2 1/4g/kg in humans. These organizations have led a campaign against LD50, which sometimes makes dead animals endure slow and painful. The term semi-lethal dose is used from time to time with the same meaning, especially in translations of texts, but can also refer to a sub-lethal dose; because of this ambiguity, it should generally be avoided. Tetrahydrocannabinol LD50 (active substance found in straw): 1270 mg/kg in rats. LD50 values are often used as a general indicator of the acute toxicity of a substance. Several countries have taken measures to ban oral LD50, and the Organisation for Economic Co-operation and Development (OECD) abolished the oral test requirement in 2001. For this reason, LD50 values are often classified with the administration system.
